

Precision medicine: Preventing cancer and chronic disease

Learn how genetics' powerful information can help keep you and your family healthy.

There has been a transformation in genetic information over the past few years. Join us for this free lecture to learn more about genetic testing and become empowered to change your potential for high-risk diseases of adulthood including cancer, cardiovascular disease and dementia.

This lecture will help you:

- Understand the difference between over-the-counter tests such as 23andMe and clinical genetic testing, as well as the purposes of each.
- Construct and analyze your medical family tree.
- Interpret the genetic basis for common chronic diseases of adulthood.
- Identify features of various cancers that predict a high-risk for hereditary disease.
- Appreciate the extraordinary advances in availability and access to genetic testing for disease and what can be done for those at risk.
